GSENM Wildlife Summary.docx

3 Sections.docx

GSENM List of Historic and Scientific Objects of Interest (1).xlsx

GSENM Proclamation Objects Highlights by area.docx

#### Josh,

Time's up and I wanted you to have more information--some of this in an unfinished condition but I hope you find it helpful.

#### Attached are 4 documents:

The object highlights was provided through other ways but I'm not sure it found you; it is a summary of highlights and new finds within GSENM--many of it paleontological. I've updated with a code in front for where the resource is located GS (Grand Staircase), KP (Kaiparowits), EC (Escalante Canyons).

GSENM Wildlife Summary: (b)(5) DPP (b)(5) ACF

3 Sections: is may attempt to get more of what's not covered in the other documents

(b)(5) DPP (b)(5) ACP

Feel free to contact me as needed over the weekend.

Matt

435-689-0136

### Grand Staircase – Escalante National Monument Highlighted Objects & Research

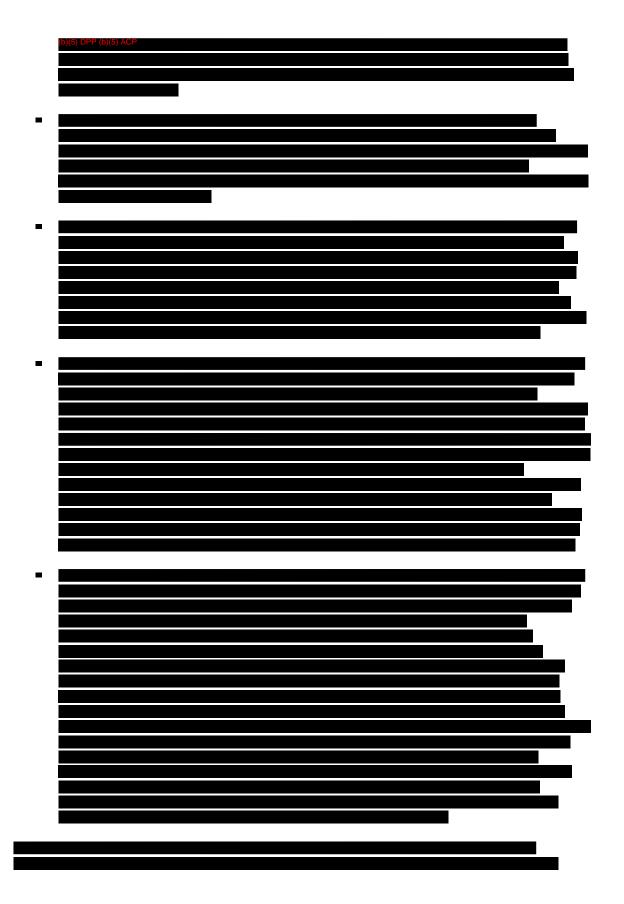

Understanding the History of Humans In the Region

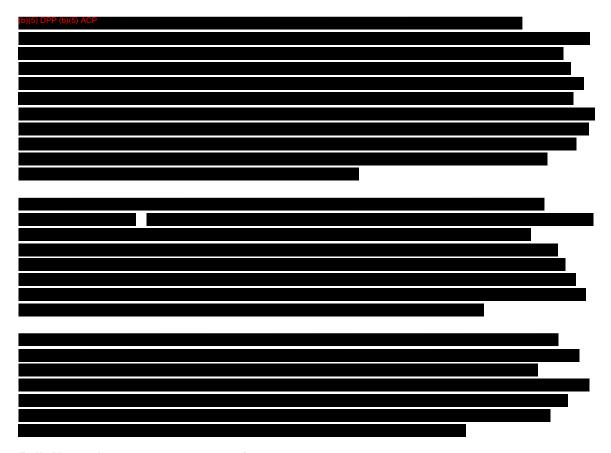

DIGI DEF (BIG) AGE	
World-Class Paleontological Sites	
(b)(5) DPP (b)(5) ACP	
	I

periods.

### Opportunities for Biological Research and Discovery

**Relic Vegetation** -- Isolated because of topography, many areas contain relatively undisturbed plant communities - some ofwhichmay have existed since the Pleistocene. No Mans Mesa Is an example where pinyon-juniper communities contain trees as much as 1,400 years old.

**Cryptobiotic Crusts** -- These crusts contain unique microbiotic communities that stabilize the highly erodible soils of the region.

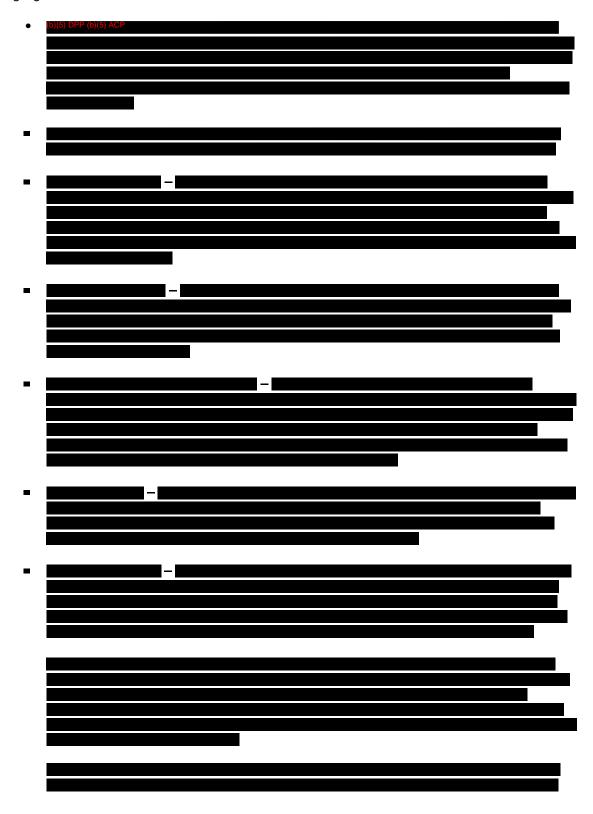

Packrat Middens -- Provide Insight into climate and vegetation over the past 25,000 years.

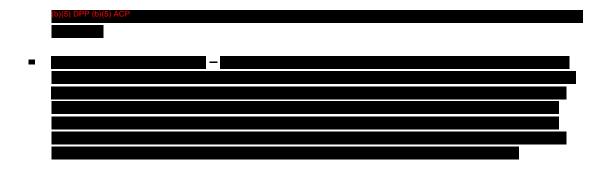

**Livestock Grazing** – The Monument has partnered with Utah State University for livestock grazing research opportunities.

**Watershed Intactness** – A study is underway to develop decision support tools for watershed management by taking a "step-down" approach to explore aquatic intactness using the Colorado Plateau—Rapid Ecoregional Assessment (COPL—REA). The case study is stepping down the COPL—REA to the Escalante River watershed, and incorporating other data, such as Aquatic AIM and geospatial approaches (e.g., Riparian vegetation models), to determine drivers of aquatic intactness in the watershed.

**Wildlife Diversity** – The proclamation highlights mountain lion, black bear, desert bighorn sheep, over 200 species of birds, peregrine falcon and bald eagle as some of the more iconic species inhabiting the Monument. However, the Monument is also home to a prolific mule deer herd and a

growing number of rocky mountain elk. Pronghorn and river otter have been reintroduced to the Monument since its creation. Highlights of introductions/augmentations, research and discovery are highlighted below:

#### <u>Grand Staircase Escalante National Monument Wildlife Summary</u>

#### <u>Threatened</u>, <u>Endangered or Candidate Species</u>:

- Mexican Spotted Owl (MSO): MSO are found within each of the three physiographic provinces of
  the Monument. There are a total of seven Protected Activity Centers (PACs) within the
  Monument. The greatest concentration of MSO lies within the Grand Staircase province along
  the Paria River corridor and its tributaries. At least four canyons that enter the Paria are known
  to have MSO. MSO have also been confirmed in the Kaiparowits and Escalante Canyons
  provinces but not to the extent as seen in the Grand Staircase province. Critical habitat for MSO
  has been delineated within the Monument, again with the highest portion being in the Grand
  Staircase province.
- Southwest Willow Flycatcher (SWWFL): SWWFL have been documented on rare occasions along
  the Paria river corridor and are thought to be migrants. No nesting SWWFL have been confirmed
  on the Monument. Critical habitat for SWWFL was delineated within GSENM in 2012 along the
  Paria which happens to be on the Grand Staircase province but is directly adjacent to the
  Kaiparowits plateau. However, this critical habitat is unoccupied and is not largely important to
  the species recovery and was opposed by Monument staff at the time of designation.
- California Condor: Condor were released on the Vermilion Cliffs National Monument to the south of GSENM. Condor are occasionally seen flying over the Grand Staircase province but are not known to nest or even forage much over the Monument.

### **Sensitive Species:**

- Greater Sage-Grouse (GRSG): GRSG are found only within the Grand Staircase province of the Monument. This area known as the Skutumpah Terrace is home to the southern-most population of GRSG in their current range. GRSG on the Monument exist in very low numbers. Habitat work is currently proposed in the area to bring the population back up.
- Peregrine Falcon (PEFA): PEFA are found and well distributed in each geographic province of the Monument. PEFA are doing extremely well and are commonly seen.
- Gold Eagle (GOEA): GOEA are found in each geographic province of the Monument. Their numbers are augmented in winter months when GOEA from areas to the north arrive to winter on the Monument. GOEA nests are found throughout the Monument.
- Bald Eagle (BAEA): BAEA are found throughout the Monument in winter months only. BAEA have recovered well since de-listing and are a common winter resident.

### **Game Species:**

Pronghorn Antelope: Pronghorn were reintroduced to the Monument on the Kaiparowits
province back in 1999 and concluding in 2005. They have since moved on to the Grand Staircase
province as well but the vast majority reside in the Kaiparowits. Pronghorn appear to be stable
on the Monument.

- Mule Deer: Mule Deer are found throughout the Monument but are very low in number in the
  Kaiparowits and Escalante Canyon provinces due to low abundance of suitable habitat. The
  Grand Staircase province is home to a very iconic herd known as the Paunsaugunt herd. This
  herd has numbers approaching 10,000 and is very popular for hunting and shed antler
  gathering. Mule deer numbers are currently increasing on the Monument. The area east of
  Kanab is critical deer winter range for this iconic herd and much habitat work has been
  accomplished to date to improve habitat condition.
- Elk: Elk are found throughout the Monument but are very low in number in the Kaiparowits and Escalante Canyon provinces due to low abundance of suitable habitat. The Grand Staircase province is home to several hundred year-round elk. Elk are increasing on the Monument.
- Desert Big Horn Sheep: Desert Big Horn sheep have been released now and again on the Monument since the mid 1970's with the focus being mostly on the Kaiparowits province. In recent history, there have also been augmentations on the Escalante Canyons province. These two provinces now have roughly the same population of bighorn sheep and both areas are increasing. Desert bighorn sheep are doing extremely well currently and continue to expand their range. Recently, more and more sheep are being reported in areas previously not occupied on the Grand Staircase province along the Paria river corridor and closer to Kanab.
- Black Bear: Black bear are extremely rare on the Monument but have been confirmed in all provinces.
- Cougar: Cougar are found throughout the Monument and are probably fairly common although
  rarely seen. The Grand Staircase province has the highest population which coincides with the
  higher population of game species such as mule deer and elk.
- Bats: Bat monitoring has confirmed 18 species within the Monument. Bats are widespread but each species tends to use habitats differently and reside at different elevation gradients. Many of the 18 species of bats are considered sensitive.

#### Special Status Fish Species:

• Six native fish species reside in the Escalante River or tributaries thereto. All of these species except the dace are considered sensitive due to their ties with the Colorado river ecosystem. The main stem of the Escalante river has confirmed speckled dace, bluehead sucker, and flannelmouth sucker. Tributaries have confirmed roundtail chub, Colorado river cutthroat trout and mottled sculpin. Many non-native species also reside in this river ecosystem.

#### **Grand Staircase**

A wide variety of formations, some in brilliant colors, have been exposed by millennia of erosion. The monument contains significant portions of a vast geologic stairway, named the Grand Staircase by pioneering geologist Clarence Dutton, which rises 5,500 feet to the rim of Bryce Canyon in an unbroken sequence of great cliffs and plateaus. (Procalamtion 6920)

include relict grasslands, of which No Mans Mesa is an outstanding example

- Bull Valley Gorge- a deeply incised slot canyon; popular hike; MSO Habitat
- No Man's Mesa
- Vermillion Cliffs see highlights
- White Cliffs see highlights
- Paria Town Site; Historic Settlement
   "Old Paria Townsite was established in 1874 on the bench
  - "Old Paria Townsite was established in 1874 on the bench above the eastern bank of the Paria River by Mormon settlers who attempted to farm the bottomlands. Site was abandoned in 1890." Abby, Edward and Hyde, Philip. Slickrock p.46.
- Mollies Nipple- "an erosional remnant is a major landmark in the area." UT BLM Statewide Final Wilderness EIS, 1990
- Remnants of Ancestral Puebloan Culture; Prehistoric Structures and features, Rock Writing/Art
  - Virgin Ancestral Puebloan /Virgin and Kayenta Ancestral Puebloan Relationships; Fremont Culture
- Plant: Ute ladies-tresses (Spiranthes diluvialis); Threatened

#### **Kaiporowits**

the Kaiparowits Plateau. That Plateau encompasses about 1,600 square miles of sedimentary rock and consists of successive south-to-north ascending plateaus or benches, deeply cut by steep-walled canyons. Naturally burning coal seams have scorched the tops of the Burning Hills brick-red. Another prominent geological feature of the plateau is the East Kaibab Monocline, known as the Cockscomb.

including the 130-foot-high Escalante Natural Bridge, with a 100 foot span, and Grosvenor Arch, a rare "double arch."

Kaiparowits Plateau's stratigraphy provide significant opportunities to study the paleontology of the late Cretaceous Era. Extremely significant fossils, including marine and brackish water mollusks, turtles, crocodilians, lizards, dinosaurs, fishes, and mammals, have been recovered from the Dakota, Tropic Shale and Wahweap Formations, and the Tibbet Canyon, Smoky Hollow and John Henry members of the Straight Cliffs Formation. Within the monument, these formations have produced the only evidence in our hemisphere of terrestrial vertebrate fauna, including mammals, of the Cenomanian-Santonian ages. This sequence of rocks, including the overlaying Wahweap and Kaiparowits formations, contains one of the best and most continuous records of Late Cretaceous terrestrial life in the world.

"Situated at the intersection of three major prehistoric cultures the Plateau has long been a magnet for archeological study. It has been recognized that the Kaiparowits Plateau might contain important clues that would aid in answering questions in the archeology of the Southwest." Utah Wilderness Coalition. Wilderness at the Edge. p. 147 and Lister, Florence C., Kaiparowits Plateau and Glen Canyon prehistory, an interpretation based on ceramics, 1964.

"Fiftymile Mountain Archeological District contains more than 400 sites including Anasazi habitations and granaries. Important scientific value. Some of the most significant cultural resources in the Four Corners area. Archaeological District (47,325 acre) has been nominated to NRHP. Majority of sites are masonry structures (of 1-10 rooms). Most are of Virgin Anasazi origin but include sites attributed to Fremont, Hopi, and Paiute. Navajo are also expected of occupying the area. 4,000 total sites may be located in WSA." Utah BLM Statewide Final Wilderness EIS, 1990.

- See highlights for dino finds
- Devil's Garden "oddly shaped arches (including Metate Arch) and rock formations in the hills at the foot of the cliffs marking the Kaiparowits Plateau." UT BLM Statewide Final Wilderness EIS, 1990

#### **Escalante Canyons**

The upper Escalante Canyons, in the northeastern reaches of the monument, are distinctive: in addition to several major arches and natural bridges, vivid geological features are laid bare in narrow, serpentine canyons, where erosion has exposed sandstone and shale deposits in shades of red, maroon, chocolate, tan, gray, and white. Such diverse objects make the monument outstanding for purposes of geologic study.

renowned Hole-in-the-Rock Trail as part of their epic colonization efforts. Sixty miles of the Trail lie within the monument, as does Dance Hall Rock, used by intrepid Mormon pioneers and now a National Historic Site.

- Remnants of Ancestral Puebloan Culture; Including Fremont Prehistoric Structures and features,
   Rock Writing/Art
- Dance Hall Rock "Dance Hall Rock/Hole-in-the-Rock Trail. While the Hole-in-the-Rock Trail was under construction in 1879, Mormon Pioneers camped at Fourtymile Spring and held meetings and dances in the shelter of Dance Hall Rock. Designated historical site by DOI 1970." Utah Wilderness Coalition. Wilderness at the Edge. P 182.
- Boulder Mail Trail "Boulder Mail Trail. Used to carry mail between Escalante and Boulder beginning in 1902. Much of trail still visible where necessary to construct through slickrock. Nominated to NRHP. Popular backpacking route." Utah BLM Statewide Final Wilderness EIS, 1990.
- Lower Calf Creek Falls- major attraction "Calf Creek Canyon is characterized by red alcoved walls, 2 waterfalls, and extensive expanses of white slickrock. Lower Calf Creek Falls drops 126'

and Upper Calf Creek's drop is 86'. High educational values associated with interpretation of these areas." UT BLM Statewide Final Wilderness EIS, 1990

Proposal Unit

## Grand Staircase-Escalante National Monument List of Historic and Scientific Objects

Description	Location	Source
Perennial streams enter entrenched canyons in		
white Navajo and deep-red Windgate		
Sandstone. Deer Creek, Steep Creek, and The		
Gulch have perennial flows of clear, cold		
water. The Gulch leads up into the spectacular		
Circle Cliffs where remarkable specimens of petrified wood (60 ft logs) exist in the	Escalante - Stepp	UT BLM Statewide Final
Morrison and Chinle formations.	Creek WSA	Wilderness EIS, 1990
Wiorrison and Chime formations.	CICCK WBA	Davidson, E.S., Geology
White Canyon cuts through the Kaibab		of the Circle Cliffs Area,
Limestone to the Coconino Sandstone, the		Garfield and Kane
oldest stratum in the Upper Escalante	Escalante-Studhorse	Counties, Utah, 1967. p.

 GSEN	<u>M 8-30-17</u>	
Description	Location	Source
from the Mojave, Arizona deserts and		
northern Utah are all found here, with a few		
species from the Great Plains. The Colorado		
Plateau is surrounded by high mountains,		
isolating the flora and fauna. Unlike many		
ecosystems, the plant density, diversity and		
stature within the monument is determined		
more by substrate than climate. Consequently,		
isolation, plus the great diversity of substrates		
(providing a wider range of soil chemisty and		
physical characteristics) found within close		
<u> </u>		
proximity to each other has resulted in a high level of plant endemism in this area. Eleven		Kaiparowits Power
species found in the monument are found		Project EIS; Axelrod,
nowhere else in the world. Of plants that		1960; Utah Natural
<u> </u>		
occur only in Utah or on the Colorado		Heritage Program plant
Plateau, 125 pecies occur in the monument.		database; Nabhen and
The Canyonlands portion of the Colorado		Wilson, 1996; Shulz,
Plateau, much of which is contained in the		1993; Albee et al., 1988;

plants. 90% of these rare and endemic species		1942; Cronquist et al.,
are found on substrates typical of most of the		1977; Utah Natural
monument. Of the Canyonlands area, the		Heritage Program plant
monument area is considered on of the most	Entire monument	database.
The Colorado Plateau was uplifted and		
downcut without deformation. As a		
consequence, large areas of unmixed geologic		
parent materials are exposed, and plants must		
adapt to large array of highly distinct parent		
materials. These substrates are sharply		
demarcated, and often occur within a few		
meters of each other. This situation offers the		
unique opportunity to examine the role of soil		
physical and chemical characteristics in		
determining plant and animal community		
structure independent of climatic variables, an		
important ecological question. It also results		
in different plant community structure and		
dynamics than is generally observed in other		
ecosystems. This area contains shales,		
siltstones, mudstones, sandstones and		
limestone of differing depths, and deposited		
in a variety of environments (marine,		
freshwater and eolian). Each soil depth and		
depositional environment has very different		
chemical and physical characteristics. As a		Hintze, 1988; Nabhen
result, there is a great diversity of substrates		and Wilson, 1996; Gross,

maintaining the evolutionary potential of	Capitol Reef NP,	1981; Soule, 1987; Soule	
plants and animals, allowing for the exchange	Box Hollow	and Wilcox, 1980;	
of genetic material among the separate		Wegner and Merriam,	
populations that constitute a population.	Wilderness	1979; Wilcove et al.,	
Cryptobiotic soil crusts are critical for soil			
stability, nutrient availability for vascular			
plants and normal soil surface temperatures.			
These crusts are extremely fragile and easily			
disrupted by soil surface disturbances such			
as trampling or off-road vehicles. Since the		D 1 1004 1005	
soils in the monument are highly susceptible		Belnap, 1994, 1995;	(b)(5) DPP (b)(5)
to erosion, it is important that these biocrusts		Belnap and Harper,	
be protected so they stabilize these erodible		1995; Belnap et al.,	
soil surfaces. In addition, these ecosystems		1994; Jefferies, 1989;	
have few nitrogen-fixing plants. Since these		Harper and Marble,	
crusts provide nitrogen to these soils, they are		1988; Johansen, 1993;	
a critical part of these nitrogen-limited		Mack and Thompson,	
ecosystems.	Entire monument	1978; Fleischner, 1994.	
		2270, 110100111101, 1777.	
Disturbance of most soil surfaces in the			
monument area will result in soil surface			
temperature changes as bio-crusted surfaces			
are darker than the substrates underneath			
them. The expected lowering of temperature			
with disturbance would result in cooler soil			
temperatures, and thus later spring plant			
germination and lower nutrient uptake rates.			
This may adversely effect desert plant growth			
in early spring. Surface temperatures also			
influence foraging and burrowing patterns for		T 4 13371 ' 0 1	
many soil invertebrates, and many effect	E di	Ludwig and Whitford

Description	Location	Source	Unit
Unique relict plant community of pinion-			
juniper and sagebrush-grass park vegetation			
accessible only by a steep trail. One of the			
few remaining unaltered plant communities in			
Utah. No Man's Mesa RNA was designated as			
an ACEC in 1986. Such areas are invaluable			
to science. They provide restoration and			
management goals for administration of			(b)(5) DPP (b)(5) ACP
lands. Such areas are also critical to scientists			
 who are trying to understand the natural	Paria-Hackberry	Utah BLM Statewide	
functioning of ecosystems. Grasslands are	WSA (No Man's	Final Wilderness EIS,	
especially valuable, as almost all have been	Mesa and Little No	1990 and Kleiner and	
heavily grazed for over a century.	Man's Mesa)	Harper, 1972	
Four Mile Bench Old Tree Area. Unique area	1,10115 1,1050)	11	
of extremely old (1,400 years) pinon and		Utah BLM Statewide	
, , , , ,			
juniper trees. Unique scientific values on	XX 1	Final Wilderness EIS,	
over 1,000 acres.	Wahweap WSA	1990.	
This region is at the northern end of areas that			
receive summer monsoonal rains, and is at the			
southern end of areas that depends on winter			
rains. This distinction is very important to the			
physiological functioning of plants in this			
moisture-limited areas, as even minor			
changes in temperature and/or rainfall may			
lead to major differences in water availability,			
and consequently, plant metabolic processes.			
Climate change is expected to alter both			
rainfall timing and amount, as well as			
temperature. This, in tum, would alter plant			
physiology, water use patterns and community		Ayyad 1981; Graff 1988;	
composition in this region, making the		Van Devender and	
monument an excellent place for studying		Spaulding 1979; Wagner	
global climate change.	Entire monument	1981.	
Unlike most deserts that are primarily			
depositional environments, the CP is an			
erosional one (Welsh 1979; Nat Hist). This			
contributes to high endemism, as substrate			
_			
material is not mixed. In addition, it makes			
this region highly susceptible to soil loss			
when surfaces are disturbed. This soil loss has			
a negative impact on plant and aquatic		Welsh, 1979; Harper et	
communities, as well as dam sediment loads.	Entire monument	al., 1994.	
The effects of scaling up and down are not			
known for many ecological processes. The			
multitude of variably sized, discrete			
watersheds found in this area offer a unique			
opportunity to test the effects of scaling for			
hydrological and biological processes. In			
addition, the close spacing of these			
watersheds offers a chance to separate the		Allen and Hoekstra 1987;

	This area contains few exotic plants. Having		
	this resource gives the opportunity to better		
	understand what factors inhibit or facilitate		
	exotic plant invasions. Roads have been		
	heavily implicated in facilitating exotic plant		
	invasion, while intact Cryptobiotic soil crusts		
	and less favorable soil chemistry may inhibit		
	such an invasion. Invasion could		Monsen and Kitchen,
PP (b)(5) ACP	fundamentally alter these communities, by		1994; Kelly 1996; Harper
	altering species composition, community		and Marble 1988;
	dynamics and fire cycles.	Entire monument	Davidson et al. 1996.
	Quaternary resources are abundant in the		
	monument. Pack rat middens enable		
	reconstruction of paleoclimates and paleo-		
	vegetation, while Pleistocene animal remains		
	found in alcoves.	Entire monument	Harper et al., 1994.
	Unlike more mesic ecosystems, there is little		
	evidence that desert communities demonstrate		
	traditional successional sequences. There is		
	little or no modification of soils or other site		
	characteristics by previous-occurring plants.		
	Understanding of this is important for		
	restoration efforts. The monument offers an		Barbour, 1981;
	excellent opportunity to study this		MacMahon, 1987;
